This sequence is from a Kenopus Gene Collection (XGC) library
constructed by Aaron M. Zorn.
CDNA was oligo dT primed from 5ug of poly A+ RNA from stages 10-13
gastrulae. EcoRI-NotI cut cDNA was then ligated into pCS107 with
CECRI at the 5' end and NotI at the 13' end.
Vector: pCS107; Site 1: ECORI; Site_2: NotI
Host: Escherichia coli XLI-blue

/note="Organ: ovary; Vector: pBluescript II KS(+); Site_1:
Constructed from 1 million independent clones. cDnA
synthesis was intifaced using an oligo(dT) primer, using
methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA
was blunted, ligated to Not! adapters, digested with
EcoRI, size-selected, and cloned into the Not! and EcoRI
comparible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soares et al., PNAS
(1994) 91: 9258-9212 and Bonaldo et al., Genome Research 6
(1996): 791, except that a significantly longer
reannealing hybridization was used."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US-09-023-655-1386
Sequence 1386, Application US/09023655
Patent No. 6607879
GENERAL INCORMATION:
APPLICANT: Cocks, Benjamin G.
APPLICANT: Susan G. Stuart
APPLICANT: Officey J. Seilhamer
TITLE OF INVENTION: COMPOSITION FOR THE DETECTION OF BLOOD CELL GENE
TITLE OF INVENTION: EXPRESSION
NUMBER OF SEQUENCES: 1508
CORRESPONDENCE ADDRESS:
ADDRESSEE: INCYTE PHARMACEUTICALS, INC.
STREET: 3174 PORTER DRIVE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-09-757-415A-1_COPY_11_140 (1-130) x US-09-621-976-12526 (1-415)
             Patent No. 663903

GENERAL INFORMATION:

APPLICANT: Dumas Milne Edwards, J.B.

APPLICANT: Glordano, J.Y.

TITLE OF INVENTION: ESTS and Encoded Human Proteins.

FILE REFERENCE: GENSET.054PR2

CURRENT APPLICATION NUMBER: US/09/621,976

CURRENT FILING DATE: 2000-07-21

NUMBER OF SEQ ID NOS: 19335

Patent No. 6218521

GENERAL INFORMATION:
APPLICANT: OBATA, Yuichi
ITILE OF INVENTION: ISOLATED NUCLEIC ACID MOLECULES ASSOCIATED
ITILE OF INVENTION: MITH GASTRIC CANCER AND METHODS FOR
ITILE OF INVENTION: DAGNOSING AND TREATING GASTRIC CANCER
NUMBER OF SEQUENCES: 87

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-757-415A-1_COPY_11_140 (1-130) x US-08-557-139-1 (1-6152)

TITLE OF INVENTION: GENES THAT REGULATE HEMATOPIETIC BLOOD FORMING STEM

TITLE OF INVENTION: GENES THAT REGULATE HEMATOPIETIC BLOOD FORMING STEM

FILLE REFERENCE: 2275-1-005

CURRENT APPLICATION NUMBER: US/09/789,919

CURRENT PILING DATE: 2001-02-21

NUMBER OF SEQ ID NOS: 260

SOFTWARE: PATENTIN Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      43 AspSerValLysTrpHisTyrLeuCysLeuArgArgTyrGlyTyrAspSerAsnLeuPhe

New isolated nucleic acid sequences encoding polypeptides useful in structure based rational drug design.

Claim 11; Page 44; 235pp; English.

The sequence represents the amino acid sequence of mouse fibroblast growth factor receptor-1 (FGFR1)-derived peptide. The invention provides fragments of suc-1-associated neurotrophic factor target protein (SNT) and fibroblast growth factor receptor (FGFR) which can form a binding complex that is amenable to structural determinations by nuclear magnetic resonance (NMR) spectroscopy. The invention provides methodology for related structure based rational drug design using the three-dimensional data. The invention complexes as described and for procedures for related structure of such complexes as described and for procedures for related structural base drug design predicated on such structural

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention discloses isolated human nucleic acid alternative splicing variants that are all tumour-involved genes (TIGs). The nucleic acids and polypeptides are useful for determining the level of a nucleic acid or polypeptide in a biological sample, for determining the nucleic acid or polypeptide sequence in a biological sample, for determining the level of variant nucleic acid or polypeptide sequences in a biological sample of variant nucleic acid or polypeptide sequences in a biological sample or inst biological sample and the level of the original sequence from which the variant has been varied by alternative splicing in a second composition comprising antibodies. A pharmaceutical composition comprising antibodies. A pharmaceutical composition comprising antibodies. A pharmaceutical composition decreasing the level of the nucleic acid, is useful for treating diseases (e.g. cancer) that can be ameliorated or cured by concar also useful for diagnostic purposes, especially for detecting cancer or a predisposition to cancer, for evaluating the state or appreciation of the original TIG, in targeting or the physiological function of the original TIG, in targeting or the physiological function of the original TIG, in targeting or the life
                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acid sequence, which is an alternative splicing variant of tumor involved genes, useful for detecting cancer, predisposition to cancer, for evaluating cancer state and in gene therapy for treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence was deduced from a cDNA clone isolated from a library prepd. from mRNA from chicken embryos (day 6). It encodes a basic fibroblast growth factor receptor which can be used for tissue repair or developement and for neuron maintainance. The DNA and protein and antibodies prepd. from it can be used to treat diseases resulting from abstrant FGF expression and for elucidating the mechanism of FGF and identifying agonists for the prevention of anglogenesis and control of tumours. See also AAR10648. (Updated on 25-MAR-2003 to correct PA field.)
oycle of the same type of cells which may be helpful for the development of pharmaceuticals for various cancer stages in which cell cycle is non-normal, for determining mutations in tumour-involved genes and in gene therapy. The polypeptides are useful for identifying compounds capable of binding to the variant product and modulating its activity and for modulating endothelial differentiation and proliferation, as well as to modulate apoptosis either ex vivo or in vivo. The sequences presented in ABG796700-ABG79705 are the new variants (NV) 1-36 proteins of the TIGs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; lung cancer associated protein; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active; vulnerary; asstrointestinal; nephrotropic; antiinfective; synecological; antibecterial; diagnosis; neural disorder; immune disorder; reproductive; proliferative disorder; wound healing; infectious disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human b-FGF receptor gene - contains recombinant DNA, chromosome DNA or cDNA base sequence encoding polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The human basic fibroblast growth factor (b-FGF) receptor protein sequence was deduced from the DNA sequence obtd. from a human placenta cDNA library in lambda gtll. The library was screened with two probes (AAQ24634,5) which were derived from the known FLG sequence (fms like gene). Posttive clones were transformed into B. coli Y1090 strain, and recombinant phage were sequenced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Polymucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AABS8106 - AABS8548. Lung cancer associated proteins and polymucleotide sequences, their agonists, and antegonists may have neuroprotective; cytostatic; cardioactive; and general; nephrotropic; antininective; cytostatic; cardioactive; and general; nephrotropic; antininective; gynecological; or antibacterial activity. The invention also includes antibodies specific for the protein or polymucleotide sequences. The lung cancer associated polymucleotide sequences may be used for detection of lung cancer, chromosome or polymucleotide sequences. The proteins may be used to treat disorders such as or research purposes. The proteins may be used to treat disorders such as certain amuscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases.

Cor bolymucleotide sequences AAF18425 - AAF18433 and peptide AABS6549 are used in the course of the invention for the identification and characterisation of the polymucleotide and protein sequences
                                                                                                                                                                                                                                                                              Lung cancer associated gene sequences, referred to as lung cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

/note= "the sequence EEKKEKE in Seq.ID.No.1 is shown as
EEKE in Fig. 2"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention covers both the full-length FGF-receptor and its soluble form (i.e. truncated by deletion of the C-terminal portion beginning at the transmembrane domain). The FGF receptor is defined as having the sequence in Columns 13-18 and Fig 2. These sequences differ slightly as indicated by the "Misc difference" in the Features Table. The receptor can be used to detect FGF or to inhibit FGF activity. Specifically, the soluble form of the receptor can inhibit FGF-dependent tumour growth, anglogenesis, psoriasis, excessive scar formation and hyperplasias and can be used to treat Herpes Simplex virus infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant human fibroblast growth factor receptor - is useful in treatment of hyperplasia(s), tumours and herpes simplex infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Expression of recombinant viral glycoproteins on host cell surfaces can be significantly enhanced by coexpression with an escort protein. The CMV glycoprotein H polypeptide (see AAR47223) is a preferred viral ecceptor. Treceptor. A full-length FGF receptor cDNA, designated fibroblast growth factor receptor. A full-length FGF receptor cDNA, designated flg5, was isolated amino acid protein having the sequence AAR47233. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Increased expression and secretion of viral protein e.g. from cytomegalovirus from host cells - by co-expression with DNA encoding an escort protein, e.g. fibroblast growth factor receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present sequence represents human fibroblast growth factor receptor 1 (FGFR1), which is encoded by a gene on human chromosome 8. A newly concluded by a gene on human chromosome 8. A newly concluded by a gene on human chromosome 8. A newly concluded by a gene on human chromosome 8. A newly concluded by a gene on human chromosome 8. A newly concluded by a gene 6 death factor factor of the farmal function of the concorded chrought (8,13) translocation to ZMF198, a concorden and the encoded oncoprotein (80LI). Molecular characterisation of the concorden and the encoded oncoprotein (see AAY06456) provides the ability concorded in the concorden can be identified with primers and probes capable of hybridizing to ZMF198 or FGFR1 tyrosine kinase domain coding capable of hybridizing ZMF198 FGFR1 can be located using a radiolabeled antibody that recognizes the fusion juncture locus. Antibodise that recognize this fusion juncture can also be used to this is useful for treatment of SCLL.
                                                                                                                            ZNF198-FGFR1; fibroblast growth factor receptor 1; oncogene; lymphoma; leukaemia; SCLL; translocation; stem cell; diagnosis; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oncogene, designated ZNF198-FGFR1, useful in diagnosis of stem cell
leukemia and lymphoma syndrome.
                                                                                                                                                                                                                           Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a murine basic fibroblast growth factor (bFGF) which is a member of the heparin-binding growth factor receptor family. This protein is used in a method which assays the ability of a substance to bind to a high-affinity heparin-binding growth factor (HBGF) receptor. The assay screens for potential anti-tumour agents that inhibit binding of HBGF to high-affinity receptors, or for potential wound healing agents that promote such binding. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Assays for high-affinity heparin-binding growth factor receptor ligands using receptor-overexpressing cells or cell-free system.
                                                                                                                                                                      Basic fibroblast growth factor receptor; bFGF; heparin binding; murine; antitumour agent; inhibitor; wound healing.

The sequence was deduced from the cDNA sequence obtd. from two overlapping clones, PL5 and PL10, isolated from a placental lambda gtll cDNA library. The DNA can be used to express recombinant bFGF receptor which is an antagonist of human aFGF and bFGF. The receptor can be used to treat abnormal anglogenesis (e.g. in diabetic retinopathy, neovascular glaucoma, etc., and possibly certain solid tumours), and in contraceptives. Dosage is 10-100 ug. (Updated on 25-MAR-2003 to correct pA field.)
                                                                                                                                                                                                               Extracellular form of human fibroblast growth factor receptor treat tumours, abnormal angiogenesis e.g. diabetic retinopathy, rheumatoid arthritis and arteriosclerosis and as contraceptives

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a human fibroblast growth factor receptor (FGFR). FGFR is useful for detecting FGF in a sample, and for inhibiting the activity of FGF. The FGFR may also be used to screen and identify compounds which mimic FGF binding: FGFR can be used to identify agonists and antagonists. The agonists identified may be used to accelerate wound healing, and the antagonists identified can be used to inhibit the growth of FGF-related malignancies
                                                                                                                                                                                                                                                                                                                                                                                  Novel fragment of a human fibroblast growth factor receptor, used to detect fibroblast growth factor in samples and to identify modulators of the factor, which are used to accelerate wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

                                                                                                                                                                                                                              g
                                                                                                                                 The protein sequence was deduced from the DNA sequence of an flg cDNA clone having increased binding for aFGF receptors. Flg and bek are clone having increased binding for aFGF receptors. Flg and bek are cannot be distinct gene products with structural features shared by the FDGF/CSF-1/C-kit family of receptor linked tyrosine kinases. They have a coff 35 residuee hydrophobic signal sequence, flg has an extracellular domain of 35 residuee and a cytoplasmic domain of 45 residues. The control of similar cannot contains 3 "immunoglobulin like" domains of similar carracellular domain contains 3 "immunoglobulin like" domains of similar can acidic box" of 8 anino acids. The Cytoplasmic domains of similar con and location. There are nine potential N-glycosylation sites. There con a macidic box" of 8 anino acids. The Cytoplasmic domains of similar caption of juxtamembrane regions followed by catalytic kinase domains which are split by 14 amino acid insertions. The kinase domains are followed by capture may be used in plarm- aceutical compsns. to inhibit undesirable content of an opportunistic pathogen to human cells. Such undesirable responses may be growth factor mediated cellular responses or to inhibit responses may be growth factor stimulated angiogenests and vaccularisation of tumours, mitogenic effects in psoriasis, arthritis, catherostelin may also be used for screening drugs for treatment of such problems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents the amino acid sequence of mouse fibroblast growth factor receptor-1 (FGFR1). The invention provides fragments of sucring growth factor receptor-1 (FGFR) which can form a binding complex that is growth factor receptor (FGFR) which can form a binding complex that is smenable to structural determinations by nuclear magnetic resonance (NMR) spectroscopy. The invention provides methodology for related structure based rational drug design using the three-dimensional data. The dimensional structure of such complexes as described and for procedures for related structure of such complexes as described and for procedures for related structural base drug design predicated on such structural
The sequence given encoded by the N-sam tumour gene. This protein could be the receptor of human bFGF. The N-sam protein and peptide fragments of N-sam are useful as anti-tumour drugs. Anti-N-sam peptide antibodies are useful for the detection of the N-sam gene product, in the purification of the N-sam gene product and in the diagnosis of tumours and anti-tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Suc-1-associated neurotrophic factor target protein; SNT-1; protein co-ordinate data; mouse; fibroblast growth factor receptor; FGFR; nuclear magnetic resonance; NMR spectroscopy; rational drug design; three-dimensional structure.
                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid sequences encoding polypeptides useful structure based rational drug design.

New pyridylpyrimidine derivatives useful in the treatment or prevention of infectious disease e.g. Kuru syndrome and Creutzfeld-Jacob disease

Disclosure; Page 63-65; 96pp; English.

The invention relates to novel pyridylpyrimidine derivatives and methods of detecting prion infections and/or prion disease in an individual or in cells, call cultures and/or cell lysates. The method involves adding at least one monoclonal or polyclonal antibody, oligonuclectide or pyridylpyrimidine derivative to the sample or in cells, cell cultures and/or cell lysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-RI (also known as fly, Fl-1, Flt-2, b-FGFR), Tk (also known as cox1), clk1, MKK7 (also known as SAPKIa, SAPKalpha), CDC2 (also known as COXI), pwRX), human cellular protein phosphateses such as PTP-SL (also known as MCPB3) and PTP-zeta, the cellular signal transduction molecules HSPB0 and GPIR-1. The invention is useful for regulating the production of prions in cells and in the manufacture of pharmaceutical composition for prophylaxis and/or treatment of infectious disease (e.g. Scrapie, chronic wasting disease (CWD), transmissible mink encephalopathy (TWE), Creutzfeldt-Jacob disease (CUD), bovine sponsiform encephalopathy (BSE), variant CUD, Gerstmann-Straussler-Scheinker syndrome (GSS), fatal familial insomnia (FRI), Kuru and Alpers syndrome, especially BSE, CUD, vCUD) or neurodegenerative diseases (e.g., Alzheimer's disease) in humans or ruminants. The present sequence is human FGF-RI protein used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A36477
hibroblast growth factor receptor A2 precursor - African clawed frog
N.Contains: fibroblast growth factor receptor A2, short splice form; protein-tyrosine ki
C;Species: Xenopus laevis (African clawed frog)
C;Species: Anopus laevis (African clawed frog)
C;Accession: A36477; C39752
C;Accession: A36477; C39752

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A Accession: A56795
A Status: preliminary
A Status: preliminary
A Status: preliminary
A Status: preliminary
A Molecule type: mRNA
A Status: 1-729 «KIM»
C Superfamily: basic fibroblast growth factor receptor 1; immunoglobulin homology simm
F Status: immunoglobulin homology «IM»
F Status: immunoglobulin homology «IM»
F Status: 1-720 «KIM»
F Status: Immunoglobulin homology «IM»

DISBASE: Defects in FGFR1 are one of the causes of Pfeiffer syndrome (FS) [MIN:101600]; Also known as acrocephalosyndactyly syndrome (FS) [MIN:101600] also known as acrocephalosyndactyly type V (ACS5). PS is characterized by craniosynostosis (premature fusion of the skull sutures) with deviation and enlargement of the thusbs and great toes, brachwasophalangy, with phalangeal ankylosis and a varying degree of soft tissue syndactyly. DISBASE: Involved in a t (8:13) (p12;q12) chromosomal translocation which involves FGFR1 and ZNF198. The resulting transcript is a possible candidate for stem cell leukemia lymphoma syndrome/SCLL. SIMILARITY: Belongs to the fibroblast growth factor receptor
                                                                                                                                                                                                                                                                                                                                                                X-RAY CRYSTALLOGRAPHY (2.4 ANGSTROMS) OF 464-762.

Blochem. Blophys. Res. Commun. 205:1057-1063(1994).
-!- FUNCTION: Receptor for basic fibroblast growth factor. A shorter
-!- FUNCTION: Receptor could be a receptor for acidic FGF (aFGF).
-!- CATALITIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SEQUENCE FROM N.A. -i- FUNCTION: RECEPTOR FOR BASIC FIBROBLAST GROWTH FACTOR.
-i- FUNCTION: RECEPTOR FOR BASIC FIBROBLAST GROWTH FACTOR.
-i- CATALXTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
-i- SUBCELULLAR LOCATION: Type I membrane protein.
-i- SUBCELULLAR LOCATION: Type I membrane protein.

-!- FUNCTION: RECEPTOR FOR BASIC FIBROBLAST GROWTH FACTOR.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
  tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Belongs to the fibroblast growth factor receptor
   -!- SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The sequence was obtd. from two overlapping clones, PL5 and PL10, stoolated from a placental lambda gtil cDNA library. The DNA can be used to express recombinant bFGF receptor which is an antagonist of human aFGF and bFGF. The receptor can be used to treat abnormal angiogenesis (e.g. in diabetic retinopathy, neovascular glaucoma, etc., and possibly certain solid tumours), and in contraceptives. Dosage is 10-100 ug. See also AAQ13308-Q13311. (Updated on 25-MAR-2003 to correct PA field.

Inhibiting expression of target gene, useful e.g. for inhibiting

```
1225 CACAGCCAGATGGCTGTGCACAAGCTGGCCAAGAGCATCCCTCTGCGCAGACAGGTAACA 1284
   Inhibiting expression of target genes, useful e.g. for treating tumors, by introducing into cells two double-stranded RNAs that are complementary to the target.
  The invention relates to inhibiting expression of a target gene (1) in a cell by introducing an inhibitory RNA (dsRNA1) having a double-stranded structure of at most 49 consecutive bases. At least part of one strand (as1) of dsRNA1 is complementary to (1) and at least one end of dsRNA1 has an overhang of 1-4 nucleotides. The method is used to inhibit the expression of a wide range of genes, e.g. oncogenes, cytokine genes etc. in humans, also genes in Plasmodium or in viruses or viroids that are pathogenic for humans, animals or plants. Introducing an overhang into both in vivo and in vitro and also increases stability and thus the effective concentration inside the cell. The present sequence is that of
   Double stranded RNA; dsRNA; RNAi; RNA inhibition; cytostatic; virucide; protocoacide; gene expression; antisense; tumour; infection; Plasmodium; virus; viroid; anti-GFP; human; HIV; human immunodeficiency virus; Hepatitis C virus; human papilloma virus; gene; ds.

   CACAGCCAGATGGCTGTGCACAAGCTGGCCAAGAGCATCCCTCTGCGCAGACAGGTAACA 1284
                 The invention relates to inhibiting expression of a target gene in a cell by introducing at least two oligoribonuclectides (darNAI and II), both with a double-stranded (ds) structure, of at most 49 sequential nucleotide pairs. At least part of one strand (S1, S2) of the ds structures in each of dsRNAI and II are complementary to regions in the target gene. The method uses antisense inhibition of gene expression using double stranded RNA inhibition (RNAI). The method is particularly used to treat tumours or infections, especially by Plasmodium or viruses/viroids (pathogenic on humans, animals or plants). The method provides more effective inhibition of expression than known methods using a single dsRNA, even at very low concentrations. When dsRNA has at least one unpaired nucleotide at the concentration of and thus effective concentration in the cell; is improved and efficiency can be increased further by pretreating the cells with interferon. The present sequence is that of a target DNA of the invention

target gene by introducing into the cell that contains the target gene at least one oligoribonucleotide (dsNAI) that has a double-stranded (ds) structure of not more than 49 consecutive nucleotides (mt), where at least a segment of one strand of the ds structure is complementary with the target gene and the cells are treated with interferon before introduction of dsNAI. The method is used to inhibit expression of protein genes, particularly oncogenes, cytokine genes, id (not define) protein genes; developmental or prion genes, or genes expressed in pathogenic corganisms (particularly plasmodia) or in viruses or viroids (pathogenic in humans, animals or plants). Treating the cells with interferon greatly increases the extent to which dsNAA can inhibit expression of the target genes, and the effect is even greater when dsNAA are modified to increase their stability. ABX09936-ABX10075 represent

sequence (Ruta et al., Oncogene, 3: 9-15). A full length flg cDNA clone was obtd. by repeated rounds of PCR using 8 primers (AAQ23610-17), and was cloned into pMA30. NIH 3T3 cells were cotransfected with a 1:20 mixture of pSy2neo and an flg expression vector contg. the flg probe inserted into pMA30 immediately downstream of the SV40 promotor and cytomegalovirus enhancer. Clones of flg transfected cells have increased binding for arGF receptors, the best being clone Nfig26 which was used for DNA sequencing. The sequence shown contains an apparent insertion (see features) which disrupts the redding frame. This is restored, chowever, by a deletion downstream in the sequence. No reference is made by the authors to these discrepancies, which are therefore assumed to be cyping errors. Receptor proteins encoded by this cDNA sequence may be composed in pharmaceutical compose, to inhibit undesirable heparin-binding comportunistic pathogen to human cells. Such undesirable responses may be growth factor stimulated angiogene is and vascularisation of tumours, cyprosertic hypertrophy. The derived flg protein may also be used for screening drugs for treatment of such problems. See also AAQ21004.

New pyridylpyrimidine derivatives useful in the treatment or prevention of infectious disease e.g. Kuru syndrome and Creutzfeld-Jacob disease (CDD).

Disclosure; Page 61-62; 96pp; English.

The invention relates to novel pyridylpyrimidine derivatives and methods of detecting prion infections and/or prion disease in an individual or in cells, cell cultures and/or cell lysates. The method involves adding at least one monoclonal or polyclonal antibody, oligonuclectide or pyridylpyrimidine derivative to the sample or in cells, cell cultures and/or cell lysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-R1 (also known as flg, R1-1, P1L-2, b-FGFR), cell lysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-R1 (also known as flg, R1-1, P1L-2, b-FGFR), ce whown as CCK-2, DDR-2 or EDDR, EC number 2.7.1.112), Abl (also known as CDK1), PRX), human cellular protein phosphatases such as PTP-SL (also known as MCP83) and PTP-zeta, the cellular signal transduction conduction of prions in cellular protein phosphateses such as PTP-SL production of prions in cellular since in the manufacture of pharmaceutical production of prions in cells and in the manufacture of pharmaceutical composition for prophylaxis and/or treatment of infectious disease (e.g., composition control wasting disease (CMD), bovine spongiform encephalopathy (TME), creutifeldt-Jacob disease (CMD), bovine spongiform encephalopathy (TME), variant CJD, Gerstmann-Straussler-Schennker syndrome (GSS), fatal familial insomnia (FFI), kuru and Alpers syndrome (GSS), fatal control or production of pharmaceutive diseases (e.g., Alzheimer's disease) in humans control or treatment of the present sequence is human FGF-R1 DNA used in the

```
Composition useful for identifying modulators of fibroblast growth factor -mediated signaling for use in treating cancer, has ternary complex of FGF-receptor, FGF ligand and heparin agonist or antagonist.
   The present invention relates to an isolated composition comprising a ternary complex of an Fibroblast of crowth Factor (FGF) ligand polypeptide (ABR56163, ABR56163, an FGF receptor polypeptide (ABR56164) and a heparin agonist or antagonist, where the agonist or antagonist binds to the FGF receptor polypeptide to form the ternary complex. The composition is useful for identifying a compound that is an inhibitor of FGF receptor activity. FGF1 is also known as

   Antisense oligomers which hybridise to the human fibroblast growth factor receptor I pre-mRNA and inhibit FGFR1 expression are claimed. The oligomers pref. hybridise to the alpha-exon region and are useful for preventing growth of tumours, esp. glioma or glioblastoma cells. The present sequence is that of the FGFR1 gene
  Inhibiting growth of tumour cells - using an anti:sense oligomer for the human fibroblast growth factor receptor-1 gene.

The human basic fibroblast growth factor (b-FGF) receptor sequence was obtd. from a human placenta cDNA library in lambda gtll. The library was screened with two probes (AAQ24634,5) which were derived from the known FLG sequence (fms like gene). Positive clones were transformed into E. coli Y1090 strain, and recombinant phage were sequenced

  The sequence was obtd. from a clone isolated from a huma ubilical vein endothelial cDNA library and a human placenta cDNA library using a probe can be also on the hflg cDNA sequence. Four types of positive clones were isolated, divided into two classes based on their restriction patterns: L2 and h3 (membrane spanning recep. tors), and h4 and h5 (secreted forms). The sequence here is that of one of the larger clones (12/h3). The sequence of bases 2857-3612 appears to be absent from the specification, with the 3' terminal of bases 3613-3636 given as: specification, with the 3' terminal of bases is growth factor creeptor which can be used for tissue repair or developement and for neuron maintainance. The DNA and procein and antibodies prepd. from it can be used to treat diseases resulting from aberrant RGF expression and for elucidating the mechanism of FGF and identify-ing agonists for the prevention of angiogenesis and control of tumours. See also AAQ10448.

The invention relates to a method of determining whether a patient will respond to treatment with a farnesyl transferase inhibitor (FTI), by analyzing the expression of gene that is differentially modulated in the presence of an FTI. The method is useful for determining whether a patient will respond to treatment with a FTI such as (B) -6. [amino (4-chlorophenyl)] (1-methyl)-1H-imidazol-5-yl) methyl]-4-(3-chlorophenyl) I methyl-2-(1H) quinolinone, monitoring the therapy of a patient, treating a patient with leukemia with FTI if the analysis indicates that the patient will respond. This sequence of FTI.
  Determining whether a patient will respond to treatment with a farnesyl transferase inhibitor, by analyzing the expression of gene that is differentially modulated in the presence of the inhibitor.

receptor 1 (FGTR1) CDNA. The FGTR1 (see AAX8717), incorporates a newly identified oncogene, ZNF198-FGTR1 (see AAX8777), incorporates a FGTR1 (see AAX8777), incorporates a rem cell throad the first see AFGTR1 (see AAX8777), incorporation to the more and the encoded oncoprotein (see AAY6456) provides the consequence and the encoded oncoprotein (see AAY6456) provides the ability to identify patients with t(8;13) (pl1;411-12) syndrome prior to onset of myeloid leukaemia. The oncogene can be identified with primers and probes capable of hybridizing to ZNF198 or FGFR1 tyrosine kinase on probes capable of hybridizing to ZNF198 or FGFR1 tyrosine kinase and probes that recognize this fusion juncture can also be used to the insing a radiolabeled antibody that recognizes the fusion juncture locus. Antibodies that recognize this fusion juncture can also be used to deliver toxic substances to patients containing the ZNF198-FGFR1 protein. This is useful for treatment of SCLL. Antisense nucleotides and ribozymes targeted to ZNF198-FGFR1 oncogene are useful for reducing expression or disrupting translation of the oncogene. (All claimed)

/note="Graga: Eye; Vector: pCWYSPORT6; Two different donor eyes (7-50 years old) yielded approximately 600 mg of dissected RPE/choroid tissue. This in turn yielded 340 ug of total RNA and 7 ug of mRNA. A directionally cloned cDNA library in the pCMYSPORT6 vector was constructed at Life Technologies (Rockville, MD; now part of Invitrogen Corp), essentially following the protocols of the SuperScript Plasmid System (Invitrogen Corp).
Plasmid System (Invitrogen. Corp.
chttp://www.invitrogen.com/>). The library code designation was cs. For this library cDNA inserts were cloned into the Not!/Mull sites of the vector. BST analysis was performed on the unamplified library at the NH Intramural Sequencing Center (NISC)."

FILE REFERENCE: 1546-R-00
CURRENT APPLICATION NUMBER: US/10/007,926A
CURRENT FILING DATE: 2000-12-08
PRIOR FILING DATE: 2000-12-08
NUMBER OF SEQ ID NOS: 468
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 182
LENGHH 4066
  1 HisSerGlnMetAlaValHisLysLeuAlaLysSerIleProLeuArgArgGlnValThr 20
  FEATURE:
CHER INFORMATION: fibroblast growth factor receptor 1
OTHER INFORMATION: (fms-related tyrosine kinase 2, pfelffer syndrome)
CHER INFORMATION: (FGFR1) gene.
